Preface **ix**

Introduction **1**

I Real Analysis 9

1 Analysis on the Real Line **11**
1.1 The Real Number Line 11
1.2 Sequences and Series 20
1.3 Open and Closed Subsets of the Line 35
1.4 Limits and Continuity 41
1.5 Calculus 53

2 Differentiation and the Lebesgue Integral **79**
2.1 Outer Measure and Vitali's Covering Theorem 79
2.2 The Lebesgue Integral as an Antiderivative 93
2.3 Measurable Sets and Functions 110

II Abstract Analysis 123

3 Analysis in Metric Spaces **125**
3.1 Metric and Topological Spaces 125
3.2 Continuity, Convergence, and Completeness 135

3.3 Compactness 146
3.4 Connectedness 158
3.5 Product Metric Spaces 165

4 Analysis in Normed Linear Spaces 173
4.1 Normed Linear Spaces 174
4.2 Linear Mappings and Hyperplanes 182
4.3 Finite–Dimensional Normed Spaces 189
4.4 The L_p Spaces 194
4.5 Function Spaces 204
4.6 The Theorems of Weierstrass and Stone 212
4.7 Fixed Points and Differential Equations 219

5 Hilbert Spaces 233
5.1 Inner Products 233
5.2 Orthogonality and Projections 237
5.3 The Dual of a Hilbert Space 252

6 An Introduction to Functional Analysis 259
6.1 The Hahn–Banach Theorem 259
6.2 Separation Theorems 275
6.3 Baire's Theorem and Beyond 279

A What Is a Real Number? 291

B Axioms of Choice and Zorn's Lemma 299

C Pareto Optimality 303
