

Contents

Preface	i
Chapter 1. LINEAR SYSTEMS OF EQUATIONS	1
1.1. Some Examples	1
1.2. Notations and a Review of Numbers	9
1.3. Gaussian Elimination: Basic Ideas	18
1.4. Gaussian Elimination: General Procedure	29
1.5. *Computational Notes and Projects	39
Review	47
Chapter 2. MATRIX ALGEBRA	49
2.1. Matrix Addition and Scalar Multiplication	49
2.2. Matrix Multiplication	55
2.3. Applications of Matrix Arithmetic	62
2.4. Special Matrices and Transposes	72
2.5. Matrix Inverses	85
2.6. Basic Properties of Determinants	96
2.7. *Applications and Proofs for Determinants	106
2.8. *Tensor Products	114
2.9. *Computational Notes and Projects	118
Review	123
Chapter 3. VECTOR SPACES	125
3.1. Definitions and Basic Concepts	125
3.2. Subspaces	135
3.3. Linear Combinations	142
3.4. Subspaces Associated with Matrices and Operators	152
3.5. Bases and Dimension	160
3.6. Linear Systems Revisited	166
3.7. *Change of Basis and Linear Operators	174

3.8. *Computational Notes and Projects	178
Review	182
Chapter 4. GEOMETRICAL ASPECTS OF STANDARD SPACES	185
4.1. Standard Norm and Inner Product	185
4.2. Applications of Norms and Inner Products	192
4.3. Unitary and Orthogonal Matrices	202
4.4. *Computational Notes and Projects	210
Review	212
Chapter 5. THE EIGENVALUE PROBLEM	213
5.1. Definitions and Basic Properties	213
5.2. Similarity and Diagonalization	223
5.3. Applications to Discrete Dynamical Systems	232
5.4. Orthogonal Diagonalization	240
5.5. *Schur Form and Applications	244
5.6. *The Singular Value Decomposition	247
5.7. *Computational Notes and Projects	250
Review	259
Chapter 6. GEOMETRICAL ASPECTS OF ABSTRACT SPACES	261
6.1. Normed Linear Spaces	261
6.2. Inner Product Spaces	266
6.3. Gram-Schmidt Algorithm	276
6.4. Linear Systems Revisited	286
6.5. *Operator Norms	295
6.6. *Computational Notes and Projects	299
Review	306
Appendix A. Table of Symbols	307
Appendix B. Solutions to Selected Exercises	309
Bibliography	323
Index	325
