

CONTENTS

Preface	20
1. An appetizer	23
FIRST PART : CLASSICAL PHYSICS – HOW DO THINGS AND IMAGES MOVE?	
CHAPTER I GALILEAN MOTION	28
2. Why should we care about motion?	28
3. Galilean physics – motion in everyday life	40
4. Global descriptions of motion: the simplicity of complexity	158
5. From the limitations of physics to the limits of motion	239
CHAPTER II SPECIAL RELATIVITY	249
6. Maximum speed, observers at rest, and motion of light	249
CHAPTER III GRAVITATION AND RELATIVITY	319
7. Maximum force: general relativity in one statement	319
8. The new ideas on space, time and gravity	344
9. Motion in general relativity – bent light and wobbling vacuum	362
10. Why can we see the stars? – Motion in the universe	402
11. Black holes – falling forever	440
12. Does space differ from time?	454
13. General relativity in ten points – a summary for the layman	460
CHAPTER IV CLASSICAL ELECTRODYNAMICS	478
14. Liquid electricity, invisible fields and maximum speed	478
15. What is light?	516
16. Charges are discrete – the limits of classical electrodynamics	545
17. Electromagnetic effects and challenges	547
18. Classical physics in a nutshell – one and a half steps out of three	568
INTERMEZZO THE BRAIN, LANGUAGE AND THE HUMAN CONDITION	584
SECOND PART : QUANTUM THEORY – WHAT IS MATTER? WHAT ARE INTERACTIONS?	
CHAPTER V QUANTA OF LIGHT AND MATTER	656
19. Minimum action – quantum theory for poets and lawyers	656
20. Light – the strange consequences of the quantum of action	668
21. Motion of matter – beyond classical physics	685
22. Colours and other interactions between light and matter	702
CHAPTER VI PERMUTATION OF PARTICLES	719
23. Are particles like gloves?	719
24. Rotations and statistics – visualizing spin	727
CHAPTER VII DETAILS OF QUANTUM THEORY AND ELECTROMAGNETISM	739
25. Superpositions and probabilities – quantum theory without ideology	739
26. Applied quantum mechanics – life, pleasure and the means to achieve them	761
27. Quantum electrodynamics – the origin of virtual reality	796

28. Quantum mechanics with gravitation – the first approach	809
CHAPTER VIII INSIDE THE NUCLEUS	836
29. The structure of the nucleus – the densest clouds	836
30. The strong nuclear interaction and the birth of matter	857
31. The weak nuclear interaction and the handedness of nature	868
32. The standard model of elementary particle physics – as seen on television	872
33. Grand unification – a simple dream	873
CHAPTER IX ADVANCED QUANTUM THEORY (NOT YET AVAILABLE)	879
CHAPTER X QUANTUM PHYSICS IN A NUTSHELL	880
INTERMEZZO BACTERIA, FLIES AND KNOTS	896
THIRD PART : MOTION WITHOUT MOTION – WHAT ARE SPACE, TIME AND PARTICLES?	
CHAPTER XI GENERAL RELATIVITY VERSUS QUANTUM MECHANICS	918
34. Does matter differ from vacuum?	920
35. Nature at large scales – is the universe something or nothing?	952
36. The physics of love – a summary of the first two and a half parts	975
37. Maximum force and minimum distance: physics in limit statements	985
38. The shape of points – extension in nature	1016
CHAPTER XII EXTENSION AND UNIFICATION (NOT YET AVAILABLE)	1046
CHAPTER XIII THE TOP OF THE MOUNTAIN (NOT YET AVAILABLE)	1047
FOURTH PART : APPENDICES	
APPENDIX A NOTATION AND CONVENTIONS	1049
APPENDIX B UNITS, MEASUREMENTS AND CONSTANTS	1060
APPENDIX C PARTICLE PROPERTIES	1078
APPENDIX D NUMBERS AND SPACES	1098
APPENDIX E INFORMATION SOURCES ON MOTION	1128
APPENDIX F CHALLENGE HINTS & SOLUTIONS	1134
APPENDIX G LIST OF ILLUSTRATIONS	1178
APPENDIX H LIST OF TABLES	1190
APPENDIX I NAME INDEX	1193
APPENDIX J SUBJECT INDEX	1216

DETAILED CONTENTS

Preface	20
1. An appetizer	23
FIRST PART : CLASSICAL PHYSICS HOW DO THINGS AND IMAGES MOVE?	
CHAPTER I GALILEAN MOTION	28
2. Why should we care about motion?	28
Does motion exist? 29 • How should we talk about motion? 31 • What are the types of motion? 32 • Perception, permanence and change 36 • Does the world need states? 38 • Curiosities and fun challenges about motion 39 •	
3. Galilean physics – motion in everyday life	40
What is velocity? 41 • What is time? 42 • Why do clocks go clockwise? 47 • Does time flow? 47 • What is space? 48 • Are space and time absolute or relative? 50 • Size: why area exists, but volume does not 51 • What is straight? 54 • A hollow Earth? 55 • Curiosities and fun challenges about everyday space and time 56 •	
How to describe motion: kinematics	61
What is rest? 63 • Objects and point particles 66 • Legs and wheels 69 •	
Objects and images	70
Motion and contact 72 • What is mass? 72 • Is motion eternal? 77 • More on conservation – energy 79 • Is velocity absolute? – The theory of everyday relativity 81 • Rotation 83 • Rolling wheels 87 • How do we walk? 87 • Is the Earth rotating? 89 • How does the Earth rotate? 94 • Does the Earth move? 96 • Is rotation relative? 99 • Curiosities and fun challenges about everyday motion 100 • Legs or wheels? – Again 106 •	
Dynamics due to gravitation	108
Properties of gravitation 111 • Dynamics: how do things move in various dimensions? 115 • Gravitation in the sky 116 • The Moon 117 • Orbits 118 • Tides 120 • Can light fall? 123 • What is mass? – Again 124 • Curiosities and fun challenges about gravitation 125 •	
What is classical mechanics?	133
Should one use force? 134 • Complete states: initial conditions 139 • Do surprises exist? Is the future determined? 141 • A strange summary about motion 144 •	
Bibliography	145
4. Global descriptions of motion: the simplicity of complexity	158
Measuring change with action	161
The principle of least action 164 • Why is motion so often bounded? 168 • Curiosities and fun challenges about Lagrangians 170 •	
Motion and symmetry	173
Why can we think and talk? 174 • Viewpoints 174 • Symmetries and groups 176 • Representations 177 • Symmetries, motion and Galilean	

physics	179	• Reproducibility, conservation and Noether's theorem	182	•
Curiosities and fun challenges about motion symmetry	187	•		
Simple motions of extended bodies – oscillations and waves	187			
Waves and their motion	189	• Why can we talk to each other? – Huygens' principle	193	• Signals
Solitary waves and solitons	195	• Curiosities and fun challenges about waves and extended bodies	197	•
Do extended bodies exist?	201			
Mountains and fractals	201	• Can a chocolate bar last forever?	202	• How high can animals jump?
Felling trees	204	• The sound of silence	205	• Little hard balls
Curiosities and fun challenges about fluids and solids	208	•		
What can move in nature?	212			
Why are objects warm?	214			
Entropy	217	• Flow of entropy	218	• Do isolated systems exist?
Why do balloons take up space? – The end of continuity	220	• Brownian motion	221	• Entropy and particles
The minimum entropy of nature: the quantum of information	224	• Why can't we remember the future?	226	• Is everything made of particles?
Why stones can be neither smooth nor fractal, nor made of little hard balls	227	• Curiosities and fun challenges about heat	228	•
Self-organization and chaos	232			
Curiosities and fun challenges about self-organization	237	•		
5. From the limitations of physics to the limits of motion	239			
Research topics in classical dynamics	239	• What is contact?	240	• Precision and accuracy
Can all of nature be described in a book?	241	• Why is measurement possible?	241	• Is motion unlimited?
242				
Bibliography	242			
CHAPTER II SPECIAL RELATIVITY	249			
6. Maximum speed, observers at rest, and motion of light	249			
Can one play tennis using a laser pulse as the ball and mirrors as rackets?	254	• Special relativity in a few lines	256	• Acceleration of light and the Doppler effect
The difference between light and sound	260	• Can one shoot faster than one's shadow?	261	• The addition of velocities
Observers and the principle of special relativity	263	• What is space-time?	266	• Can we travel to the past? – Time and causality
268				
Curiosities of special relativity	269			
Faster than light: how far can we travel?	269	• Synchronization and aging: can a mother stay younger than her own daughter? – Time travel to the future	270	• Length contraction
Relativistic movies – aberration and Doppler effect	275	• Which is the best seat in a bus?	277	• How fast can one walk?
Is the speed of shadow greater than the speed of light?	278	• Parallel to parallel is not parallel – Thomas rotation	282	• A never-ending story: temperature and relativity
282				
Relativistic mechanics	282			
Mass in relativity	283	• Why relativistic snooker is more difficult	284	• Mass is concentrated energy
Collisions, virtual objects and tachyons	287	• Systems of particles: no centre of mass	289	• Why is most motion so slow?
The history of the mass–energy equivalence formula by de Pretto and Einstein	290	• Four-vectors	291	• Four-momentum
294				

• Four-force 295 • Rotation in relativity 295 • Wave motion 297 • The action of a free particle – how do things move? 297 • Conformal transformations: Why is the speed of light constant? 298 •	
Accelerating observers	300
Acceleration for inertial observers 301 • Accelerating frames of reference 302 • Event horizons 306 • Acceleration changes colours 307 • Can light move faster than c ? 308 • What is the speed of light? 309 • Limits on the length of solid bodies 309 •	
Special relativity in four sentences	310
Could the speed of light vary? 311 • What happens near the speed of light? 311 •	
Bibliography	312
CHAPTER III GRAVITATION AND RELATIVITY	319
7. Maximum force: general relativity in one statement	319
The maximum force and power limits 320 • The experimental evidence 322 • Deducing general relativity 323 • Space-time is curved 327 • Conditions of validity of the force and power limits 328 • Gedanken experiments and paradoxes about the force limit 329 • Gedanken experiments with the power limit and the mass flow limit 333 • Hide and seek 336 • An intuitive understanding of general relativity 336 • An intuitive understanding of cosmology 339 • Experimental challenges for the third millennium 339 • A summary of general relativity 341 • Bibliography 342 •	
8. The new ideas on space, time and gravity	344
Rest and free fall 344 • What is gravity? – A second answer 345 • What tides tell us about gravity 348 • Bent space and mattresses 349 • Curved space-time 351 • The speed of light and the constant of gravitation 353 • Why does a stone thrown into the air fall back to Earth? – Geodesics 354 • Can light fall? 357 •	
Curiosities about gravitation	358
What is weight? 361 • Why do apples fall? 362 •	
9. Motion in general relativity – bent light and wobbling vacuum	362
Weak fields	363
The Thirring effects 363 • Gravitomagnetism 365 • Gravitational waves 368 • Bending of light and radio waves 375 • Time delay 376 • Effects on orbits 377 • The geodesic effect 379 • Curiosities about weak fields 379 •	
How is curvature measured?	380
Curvature and space-time 383 • Curvature and motion in general relativity 384 • Universal gravity 385 • The Schwarzschild metric 386 • Curiosities and fun challenges about curvature 386 •	
All observers: heavier mathematics	387
The curvature of space-time 387 • The description of momentum, mass and energy 388 • Hilbert's action – how do things fall 390 • The symmetries of general relativity 391 • Einstein's field equations 391 • More on the force limit 394 • Deducing universal gravity 395 • Deducing linearized general relativity 396 • How to calculate the shape of geodesics 396 • Mass in general relativity 398 • Is gravity an interaction? 398 • The essence of general relativity 399 • Riemann gymnastics 400 •	
10. Why can we see the stars? – Motion in the universe	402

Which stars do we see? 402 • What do we see at night? 405 • What is the universe? 409 • The colour and the motion of the stars 412 • Do stars shine every night? 414 • A short history of the universe 415 • The history of space-time 418 • Why is the sky dark at night? 422 • Is the universe open, closed or marginal? 424 • Why is the universe transparent? 426 • The big bang and its consequences 427 • Was the big bang a big bang? 427 • Was the big bang an event? 427 • Was the big bang a beginning? 428 • Does the big bang imply creation? 429 • Why can we see the Sun? 429 • Why are the colours of the stars different? 430 • Are there dark stars? 432 • Are all stars different? – Gravitational lenses 432 • What is the shape of the universe? 434 • What is behind the horizon? 435 • Why are there stars all over the place? – Inflation 435 • Why are there so few stars? – The energy and entropy content of the universe 436 • Why is matter lumped? 437 • Why are stars so small compared with the universe? 437 • Are stars and galaxies moving apart or is the universe expanding? 437 • Is there more than one universe? 438 • Why are the stars fixed? – Arms, stars and Mach's principle 438 • At rest in the universe 439 • Does light attract light? 440 • Does light decay? 440 •	
11. Black holes – falling forever	440
Why study black holes? 441 • Horizons 441 • Orbits 444 • Hair and entropy 446 • Black holes as energy sources 448 • Paradoxes, curiosities and challenges 449 • Formation of and search for black holes 451 • Singularities 452 • A quiz: is the universe a black hole? 453 •	
12. Does space differ from time?	454
Can space and time be measured? 455 • Are space and time necessary? 456 • Do closed timelike curves exist? 457 • Is general relativity local? – The hole argument 457 • Is the Earth hollow? 458 • Are space, time and mass independent? 459 •	
13. General relativity in ten points – a summary for the layman	460
The accuracy of the description 461 • Research in general relativity and cosmology 461 • Could general relativity be different? 463 • The limits of general relativity 464 •	
Bibliography	465
CHAPTER IV CLASSICAL ELECTRODYNAMICS	478
14. Liquid electricity, invisible fields and maximum speed	478
Amber, lodestone and mobile phones	478
How can one make lightning? 480 • Electric charge and electric fields 483 • Can we detect the inertia of electricity? 487 • Feeling electric fields 489 • Magnets 490 • Can humans feel magnetic fields? 490 • How can one make a motor? 491 • Magnetic fields 493 • How motors prove relativity to be right 497 • Curiosities and fun challenges about things electric and magnetic 498 •	
The description of electromagnetic field evolution	503
Colliding charged particles 505 • The gauge field: the electromagnetic vector potential 506 • Energy, linear and angular momentum of the electromagnetic field 510 • The Lagrangian of electromagnetism 510 • Symmetries: the energy–momentum tensor 511 • What is a mirror? 512 • What is the difference between electric and magnetic fields? 514 •	
Electrodynamic challenges and curiosities	515
Could electrodynamics be different? 515 • The toughest challenge for elec-	

rodynamics 515 •	
15. What is light?	516
The slowness of progress in physics 524 • Does light travel in a straight line? 524 • The concentration of light 527 • Can one touch light? 528 • War, light and lies 530 • What is colour? 531 • What is the speed of light? – Again 533 • 200 years too late: negative refraction indices 536 • Signals and predictions 537 • How does the world look when riding on a light beam? 537 • Does the aether exist? 537 •	
Challenges and curiosities about light	538
How to prove you're holy 538 • Do we see what exists? 539 • How does one make pictures of the inside of the eye? 541 • How does one make holograms and other 3-d images? 542 • Imaging 544 •	
16. Charges are discrete – the limits of classical electrodynamics	545
How fast do charges move? 545 • Challenges and curiosities about charge discreteness 546 •	
17. Electromagnetic effects and challenges	547
Is lightning a discharge? – Electricity in the atmosphere 551 • Does gravity make charges radiate? 553 • Research questions 554 • Levitation 555 • Matter, levitation and electromagnetic effects 558 • Why can we see each other? 565 • A summary of classical electrodynamics and of its limits 567 •	
18. Classical physics in a nutshell – one and a half steps out of three	568
The future of planet Earth 569 • The essence of classical physics: the infinitely small implies the lack of surprises 571 • Why have we not yet reached the top of the mountain? 572 •	
Bibliography	573
INTERMEZZO THE BRAIN, LANGUAGE AND THE HUMAN CONDITION	584
Evolution 585 •	
Children and physics	585
Why a brain? 588 • What is information? 589 • What is memory? 590 • The capacity of the brain 592 •	
What is language?	594
What is a concept? 597 • What are sets? What are relations? 599 • Infinity 601 • Functions and structures 603 • Numbers 604 • Why use mathematics? 608 • Is mathematics a language? 609 • Curiosities and fun challenges 610 •	
Physical concepts, lies and patterns of nature	611
Are physical concepts discovered or created? 612 • How do we find physical patterns and rules? 614 • What is a lie? 615 • Is this statement true? 619 • Challenges about lies 620 •	
Observations	621
Have enough observations been recorded? 622 • Are all physical observables known? 623 • Do observations take time? 625 • Is induction a problem in physics? 625 •	
The quest for precision and its implications	627
What are interactions? – No emergence 628 • What is existence? 628 • Do things exist? 630 • Does the void exist? 631 • Is nature infinite? 632 • Is the universe a set? 633 • Does the universe exist? 634 • What is creation? 635 • Is nature designed? 637 • What is a description? 638 •	

Reason, purpose and explanation 639 • Unification and demarcation 640 • Pigs, apes and the anthropic principle 641 • Does one need cause and effect in explanations? 643 • Is consciousness required? 644 • Curiosity 644 • Courage 647 •	
Bibliography	648

SECOND PART : QUANTUM THEORY WHAT IS MATTER? WHAT ARE INTERACTIONS?

CHAPTER V QUANTA OF LIGHT AND MATTER	656
19. Minimum action – quantum theory for poets and lawyers	656
Gedanken experiments and challenges 667 •	
20. Light – the strange consequences of the quantum of action	668
What is colour? 668 • What is light? – Again 671 • The size of photons 672 • Are photons countable? – Squeezed light 672 • The position of photons 675 • Are photons necessary? 676 • How can a wave be made up of particles? 678 • Can light move faster than light? – Virtual photons 683 • Indeterminacy of electric fields 684 • Curiosities and fun challenges about photons 684 •	
21. Motion of matter – beyond classical physics	685
Wine glasses and pencils 685 • Cool gas 686 • No rest 686 • Flows and the quantization of matter 687 • Quantons 687 • The motion of quantons – matter as waves 688 • Rotation and the lack of North Poles 690 • Silver, Stern and Gerlach 692 • The language of quantum theory and its description of motion 693 • The evolution of operators 695 • The state – or wave function – and its evolution 695 • Why are atoms not flat? Why do shapes exist? 697 • Rest: spread and the quantum Zeno effect 697 • Tunnelling, hills and limits on memory 698 • Spin and motion 699 • Relativistic wave equations 700 • Maximum acceleration 701 • Curiosities and fun challenges about quantum theory 701 •	
22. Colours and other interactions between light and matter	702
What are stars made of? 703 • What determines the colour of atoms? 704 • Relativistic hydrogen 706 • Relativistic wave equations – again 707 • Antimatter 708 • Virtual particles and QED diagrams 709 • Compositeness 710 • Curiosities and fun challenges about colour 711 • The strength of electromagnetism 712 •	
Bibliography	713
CHAPTER VI PERMUTATION OF PARTICLES	719
23. Are particles like gloves?	719
Why does indistinguishability appear in nature? 721 • Can particles be counted? 721 • What is permutation symmetry? 722 • Indistinguishability and symmetry 722 • The behaviour of photons 724 • The energy dependence of permutation symmetry 724 • Indistinguishability in quantum field theory 725 • How accurately is permutation symmetry verified? 726 • Copies, clones and gloves 726 •	
24. Rotations and statistics – visualizing spin	727

The belt trick 730 • The Pauli exclusion principle and the hardness of matter 732 • Integer spin 733 • Is spin a rotation about an axis? 734 • Why is fencing with laser beams impossible? 735 • Rotation requires anti-particles 735 • Limits and open questions of quantum statistics 736 •	
Bibliography	736
CHAPTER VII DETAILS OF QUANTUM THEORY AND ELECTROMAGNETISM	739
25. Superpositions and probabilities – quantum theory without ideology	739
Why are people either dead or alive?	739
Conclusions on decoherence, life and death 745 •	
What is a system? What is an object?	746
Is quantum theory non-local? – A bit about Einstein-Podolsky-Rosen 747 •	
Curiosities 749 •	
What is all the fuss about measurements in quantum theory?	750
Hidden variables 754 •	
Conclusions on probabilities and determinism	756
What is the difference between space and time? 758 • Are we good observers? 758 • What connects information theory, cryptology and quantum theory? 759 • Does the universe have a wave function? And initial conditions? 760 •	
26. Applied quantum mechanics – life, pleasure and the means to achieve them	761
Biology	761
Reproduction 762 • Quantum machines 763 • How do we move? – Molecular motors 763 • Curiosities and fun challenges about biology 766 •	
The physics of pleasure	768
The nerves and the brain 771 • Clocks in quantum mechanics 771 • Do clocks exist? 772 • Living clocks 774 • Metre sticks 775 • Why are predictions so difficult, especially of the future? 775 • Decay and the golden rule 775 • Zeno and the present in quantum theory 777 • What is motion? 777 • Consciousness: a result of the quantum of action 778 • Why can we observe motion? 779 • Curiosities and fun challenges about quantum experience 779 •	
Chemistry – from atoms to DNA	780
Ribonucleic acid and Deoxyribonucleic acid 782 • Chemical challenges and curiosities 783 •	
Materials science	783
Why does the floor not fall? 783 • Rocks and stones 784 • How can one look through matter? 784 • What is necessary to make matter invisible? 785 • How does matter behave at lowest temperatures? 787 • Curiosities and fun challenges about materials science 787 •	
Quantum technology	789
Motion without friction – superconductivity and superfluidity 789 • Quantized conductivity 791 • The fractional quantum Hall effect 791 • Lasers and other spin-one vector boson launchers 792 • Can two photons interfere? 794 • Can two electron beams interfere? 795 • Challenges and dreams about quantum technology 796 •	
27. Quantum electrodynamics – the origin of virtual reality	796
Ships, mirrors and the Casimir effect 796 • The Banach–Tarski paradox for vacuum 798 • The Lamb shift 799 • The QED Lagrangian 799 • Interactions and virtual particles 799 • Vacuum energy 800 • Moving mirrors 800	

• Photon hitting photons 800 • Is the vacuum a bath? 801 • Renormalization – why is an electron so light? 801 •	
Curiosities and fun challenges of quantum electrodynamics	802
How can one move on perfect ice? – The ultimate physics test 805 •	
Summary of quantum electrodynamics	806
Open questions in QED 808 •	
28. Quantum mechanics with gravitation – the first approach	809
Corrections to the Schrödinger equation 810 • A rephrased large number hypothesis 810 • Is quantum gravity necessary? 811 • Limits to disorder 811 • Measuring acceleration with a thermometer: Fulling–Davies–Unruh radiation 812 •	
Black holes aren't black	813
Gamma ray bursts 815 • Material properties of black holes 817 • How do black holes evaporate? 818 • The information paradox of black holes 818 • More paradoxes 820 •	
Quantum mechanics of gravitation	820
The gravitational Bohr atom 821 • Decoherence of space-time 821 • Do gravitons exist? 822 • Space-time foam 822 • No particles 823 • No science fiction 823 • Not cheating any longer 824 •	
Bibliography	824
CHAPTER VIII INSIDE THE NUCLEUS	836
29. The structure of the nucleus – the densest clouds	836
A physical wonder: magnetic resonance imaging 836 • The size of nuclei 837 • Nuclei are composed 840 • Nuclei can move alone – cosmic rays 843 • Nuclei decay 847 • Nuclei can form composites 849 • Nuclei have colours and shapes 849 • Motion in the nuclear domain – four types of motion 851 • Nuclei react 851 • Bombs and nuclear reactors 852 • The Sun 853 • Curiosities and fun challenges on radioactivity 855 •	
30. The strong nuclear interaction and the birth of matter	857
Why do the stars shine? 857 • Where do our atoms come from? 860 • The weak side of the strong interaction 860 • Bound motion, the particle zoo and the quark model 861 • The mass, shape, and colour of protons 862 • Experimental consequences of the quark model 863 • The Lagrangian of quantum chromodynamics 864 • The sizes and masses of quarks 866 • Confinement and the future of the strong interaction 867 • Curiosities about the strong interactions 867 •	
31. The weak nuclear interaction and the handedness of nature	868
Curiosities about the weak interactions 869 • Mass, the Higgs boson and a ten thousand million dollar lie 870 • Neutrino and other curiosities about the electroweak interaction 871 •	
32. The standard model of elementary particle physics – as seen on television	872
Conclusion and open questions about the standard model 873 •	
33. Grand unification – a simple dream	873
Experimental consequences 874 • The state of grand unification 875 •	
Bibliography	876
CHAPTER IX ADVANCED QUANTUM THEORY (NOT YET AVAILABLE)	879
CHAPTER X QUANTUM PHYSICS IN A NUTSHELL	880
Quantum theory's essence: the lack of the infinitely small	880

Achievements in precision 880 • Physical results of quantum theory 882 • Results of quantum field theory 884 • Is quantum theory magic? 885 • The dangers of buying a can of beans 886 •	
The essence and the limits of quantum theory	887
What is unexplained by quantum theory and general relativity? 887 • How to delude oneself that one has reached the top of the Motion Mountain 890 • What awaits us? 893 •	
Bibliography	894
INTERMEZZO BACTERIA, FLIES AND KNOTS	896
Bumble-bees and other miniature flying systems 896 • Swimming 899 • Falling cats and the theory of shape change 903 • Turning a sphere inside out 903 • Knots, links and braids 904 • Knots in nature and on paper 907 • Clouds 909 • Fluid space-time 910 • Solid space-time 910 • Swimming in curved space 912 • Curiosities and fun challenges 913 • Outlook 914 •	
Bibliography	914
 THIRD PART : MOTION WITHOUT MOTION WHAT ARE SPACE, TIME AND PARTICLES? 	
CHAPTER XI GENERAL RELATIVITY VERSUS QUANTUM MECHANICS	918
The contradictions 918 •	
34. Does matter differ from vacuum?	920
Planck scales 921 • Farewell to instants of time 923 • Farewell to points in space 925 • Farewell to the space-time manifold 927 • Farewell to observables and measurements 930 • Can space-time be a lattice? – A glimpse of quantum geometry 931 • Farewell to particles 932 • Farewell to mass 935 • Curiosities and fun challenges 938 • Farewell to the big bang 940 • The baggage left behind 941 •	
Some experimental predictions	941
Bibliography	946
35. Nature at large scales – is the universe something or nothing?	952
Cosmological scales 952 • Maximum time 953 • Does the universe have a definite age? 954 • How precisely can ages be measured? 954 • Does time exist? 955 • What is the error in the measurement of the age of the universe? 956 • Maximum length 959 • Is the universe really a big place? 960 • The boundary of space-time – is the sky a surface? 961 • Does the universe have initial conditions? 962 • Does the universe contain particles and stars? 962 • Does the universe contain masses and objects? 963 • Do symmetries exist in nature? 965 • Does the universe have a boundary? 965 • Is the universe a set? 966 • Curiosities and fun challenges 968 • Hilbert's sixth problem settled 968 • Does the universe make sense? 969 • A concept without a set eliminates contradictions 970 • Extremal scales and open questions in physics 971 • Is extremal identity a principle of nature? 971 •	
Bibliography	973
36. The physics of love – a summary of the first two and a half parts	975
Bibliography	983

37. Maximum force and minimum distance: physics in limit statements	985
Fundamental limits to all observables	985
Special relativity in one statement 985 • Quantum theory in one statement 986 • General relativity in one statement 988 • Deducing general relativity 989 • Deducing universal gravitation 992 • The size of physical systems in general relativity 992 • A mechanical analogy for the maximum force 992 •	
Units and limit values for all physical observables	993
Limits to space and time 994 • Mass and energy limits 995 • Virtual particles – a new definition 996 • Limits in thermodynamics 996 • Electromagnetic limits and units 997 • Vacuum and mass-energy – two sides of the same coin 998 • Paradoxes and curiosities about Planck limits 999 •	
Upper and lower limits to observables	1001
Size and energy dependence 1001 • Angular momentum, action and speed 1002 • Force, power and luminosity 1003 • Acceleration 1003 • Momentum 1004 • Lifetime, distance and curvature 1004 • Mass change 1004 • Mass and density 1005 • The strange charm of the entropy bound 1005 • Temperature 1007 • Electromagnetic observables 1007 • Paradoxes and challenges around the limits 1008 •	
Limits to measurement precision and their challenge to thought	1009
Measurement precision and the existence of sets 1009 • Why are observers needed? 1011 • A solution to Hilbert's sixth problem 1011 • Outlook 1012 • Bibliography 1012 •	
38. The shape of points – extension in nature	1016
Introduction: vacuum and particles 1017 • How else can we show that matter and vacuum cannot be distinguished? 1018 •	
Argument 1: The size and shape of elementary particles	1019
Do boxes exist? 1020 • Can the Greeks help? – The limits of knives 1020 • Are cross-sections finite? 1021 • Can one take a photograph of a point? 1021 • What is the shape of an electron? 1023 • Is the shape of an electron fixed? 1024 •	
Argument 2: The shape of points in vacuum	1025
Measuring the void 1026 • What is the maximum number of particles that fits inside a piece of vacuum? 1027 •	
Argument 3: The large, the small and their connection	1027
Small is large? 1028 • Unification and total symmetry 1028 •	
Argument 4: Does nature have parts?	1030
Does the universe contain anything? 1032 • An amoeba 1032 •	
Argument 5: The entropy of black holes	1033
Argument 6: Exchanging space points or particles at Planck scales	1035
Argument 7: The meaning of spin	1036
Present research	1037
Conceptual checks of extension 1038 • Experimental falsification of models based on extended entities 1039 • Possibilities for confirmation of extension models 1039 • Curiosities and fun challenges 1040 • An intermediate status report 1041 • Sexual preferences in physics 1041 • A physical aphorism 1041 •	
Bibliography	1042
CHAPTER XII EXTENSION AND UNIFICATION (NOT YET AVAILABLE)	1046

CHAPTER XIII THE TOP OF THE MOUNTAIN (NOT YET AVAILABLE) 1047

FOURTH PART : APPENDICES

APPENDIX A	NOTATION AND CONVENTIONS	1049
	The symbols used in the text 1049 • The Latin alphabet 1051 • The Greek alphabet 1052 • The Hebrew alphabet and other scripts 1054 • Digits and numbers 1055 • Calendars 1056 • Abbreviations and eponyms or concepts? 1057 • Bibliography 1058 •	
APPENDIX B	UNITS, MEASUREMENTS AND CONSTANTS	1060
	Planck's natural units 1063 • Other unit systems 1064 • Curiosities 1066 • Precision and accuracy of measurements 1069 • Basic physical constants 1069 • Useful numbers 1074 • Bibliography 1075 •	
APPENDIX C	PARTICLE PROPERTIES	1078
	Bibliography 1096 •	
APPENDIX D	NUMBERS AND SPACES	1098
	Numbers as mathematical structures 1098	
	Complex numbers 1099 • Quaternions 1101 • Octonions 1105 • Other types of numbers 1107 • Grassmann numbers 1107 •	
	Vector spaces 1107	
	Algebras 1109	
	Lie algebras 1112 • Classification of Lie algebras 1113 • Lie superalgebras 1114 • The Virasoro algebra 1115 • Kac–Moody algebras 1115 •	
	Topology – what shapes exist? 1116	
	Topological spaces 1116 • Manifolds 1117 • Holes, Homotopy and Homology 1119 •	
	Types and classification of groups 1120	
	Lie groups 1121 • Connectedness 1122 • Compactness 1122 •	
	Mathematical curiosities and fun challenges 1126	
	Bibliography 1126	
APPENDIX E	INFORMATION SOURCES ON MOTION	1128
APPENDIX F	CHALLENGE HINTS & SOLUTIONS	1134
APPENDIX G	LIST OF ILLUSTRATIONS	1178
	Picture credits 1188 •	
APPENDIX H	LIST OF TABLES	1190
APPENDIX I	NAME INDEX	1193
APPENDIX J	SUBJECT INDEX	1216
