Contents

Acknowledgement **ii**

1 Group Theory **1**
1.1 Review of Important Basics 1
1.2 The Concept of a Group Action 5
1.3 Sylow's Theorem 12
1.4 Examples: The Linear Groups 14
1.5 Automorphism Groups 16
1.6 The Symmetric and Alternating Groups 22
1.7 The Commutator Subgroup 28
1.8 Free Groups; Generators and Relations 36

2 Field and Galois Theory **42**
2.1 Basics 42
2.2 Splitting Fields and Algebraic Closure 47
2.3 Galois Extensions and Galois Groups 50
2.4 Separability and the Galois Criterion 55
2.5 Brief Interlude: the Krull Topology 61
2.6 The Fundamental Theorem of Algebra 62
2.7 The Galois Group of a Polynomial 62
2.8 The Cyclotomic Polynomials 66
2.9 Solvability by Radicals 69
2.10 The Primitive Element Theorem 70

3 Elementary Factorization Theory **72**
3.1 Basics 72
3.2 Unique Factorization Domains 76
3.3 Noetherian Rings and Principal Ideal Domains 81

3.4 Principal Ideal Domains and Euclidean Domains 84

4 Dedekind Domains **87**
4.1 A Few Remarks About Module Theory 87
4.2 Algebraic Integer Domains 91
4.3 $\mathcal{O}_{\mathbb{E}}$ is a Dedekind Domain 96
4.4 Factorization Theory in Dedekind Domains 97
4.5 The Ideal Class Group of a Dedekind Domain 100
4.6 A Characterization of Dedekind Domains 101

5 Module Theory **105**
5.1 The Basic Homomorphism Theorems 105
5.2 Direct Products and Sums of Modules 107
5.3 Modules over a Principal Ideal Domain 115
5.4 Calculation of Invariant Factors 119
5.5 Application to a Single Linear Transformation 123
5.6 Chain Conditions and Series of Modules 129
5.7 The Krull-Schmidt Theorem 132
5.8 Injective and Projective Modules 135
5.9 Semisimple Modules 142
5.10 Example: Group Algebras 146

6 Ring Structure Theory **149**
6.1 The Jacobson Radical 149

7 Tensor Products **154**
7.1 Tensor Product as an Abelian Group 154
7.2 Tensor Product as a Left S-Module 158
7.3 Tensor Product as an Algebra 163
7.4 Tensor, Symmetric and Exterior Algebra 165
7.5 The Adjointness Relationship 172

A Zorn's Lemma and some Applications **175**
