## Choose the Best Platform for Your ASP

ASP take advantage of existing Internet connectivity to offer corporations the opportunity to outsource not only peripheral applications but also mission-critical applications. This trend will continue to escalate as customers discover that outsourcing firms can deliver mission-critical applications that meet their demands for service licensing agreements (SLAs). For ISPs and ASPs, these application-hosting responsibilities require the choice of a platform that can deliver the correct balance of performance, scalability, upgradeability and manageability.

## Foreword

## Review ASP Decision Criteria

Current Analysis published the results of their survey of ASP customers that ranked the major decision criteria they used to choose an ASP provider. Major factors included:

- Support Capabilities
- Hosting and Facility Experience
- Cost and Pricing Structure
- Reputation and Client Reference
- Service Level Agreement
- Past Performance
- Scalability and Completeness of Solution

## Chapter 2 The Business Case 59

Introduction	60
ISP Market Conditions	61
The Onset of Commoditization	63
Broadband—The Enabling Technology	64
Service Provider Business Requirements	67

## **Chapter 3 Server Level Considerations 109**

### **Understand How Servers Work in Your Environment**

ASP's need to support content, database information, storage area networking (SAN), and file servers to truly provide well-rounded application service offerings. These "server farms" must be maintained and supported with the priority that the application demands. Remember that the design of a system and implementation of an infrastructure that will work for your company and satisfy your customers will require exceptionally careful planning and forethought.

Introduction	110
Implementation, Where to Begin	111
Server Hardware	111
Central Processing Unit	112
Symmetric Multiprocessing	114
Random Access Memory	115
Mass Storage	116
Network Adapters	118
Software Solutions for Your ASP	133
System Software	133
Application Software Types	137

## Chapter 4 Performance Enhancement Technologies **187**

### Content Delivery Networks and Streaming Media

Content Delivery Networks can provide more efficient service, as they can store and forward multiple formats and bit rates for streaming media. A number of companies now offer streaming media appliances:

- Midstream—  
[www.midstream.com](http://www.midstream.com)
- Network Engines—  
[www.networkengines.com](http://www.networkengines.com)
- Vingage—  
[www.vingage.com](http://www.vingage.com)
- Vividon—  
[www.vividon.com](http://www.vividon.com)

Introduction	188
What Is Web Caching?	189
What Is Load Balancing?	189
What Is Content Routing?	189
Web Caching and How It Works	189
What Is Data Caching?	190
The Benefits of Data Caching?	191
What Happens With and Without a Solution in Place	193
How to Reduce Bandwidth Usage	195
Key Requirements for a Caching Solution	195
Deployment Models for Data Caching	197

Introduction	258
Upfront Concerns and Selection Criteria	259
Concerns for Your Storage Devices	259
Host Independence	259
Mixed Vendor Support	260

## Choose the Best Storage Solution for Your Company

Six major concerns and criteria should be taken into account before deciding on the storage solution that best fits your requirements:

- Host independence
- Mixed vendor support
- Security
- Legacy support
- System availability
- Price versus performance

Security	260
Legacy Support	261
System Availability	262

Frequently Asked Questions	361

### Learn the Three Main Areas of Service Level Agreements

- **Planning** Determining the wide area network (WAN) service levels.
- **Verification** Monitoring the service levels to guarantee fulfillment.
- **Troubleshooting** Isolating issues when service levels are not delivered.

## Chapter 7 Management and Monitoring 363

Introduction	364
The Effect of Outsourcing	364
Service Level Agreements	365
Some Common SLA Guarantees	365
What Are the Basic Components of SLAs for Frame Relay Circuits?	366
What Service Levels Should the Service Provider Consider?	368
Network Availability	369
PVC Availability	369
Average Network Delay and Average PVC Delay	370
Effective Throughput	370
Response Time	371
Time to Resolution or Repair	371
The Realities of Customer Compensation	371
What Will Your Customers Look for in Their Implemented SLA?	372
What Are the Guidelines for Implementing the Monitoring Necessary to Handle These Tasks?	372
Where Is Your Weakest Link?	373
Network SLAs	374
System Level SLAs	374
Application SLAs	374
Making Your Company More Customer Oriented	375
How Service Providers Have Responded	376
Acceptable Performance	376
The Added Bonus	377
The Operation Support System Model	377
What Are the Basics of OSS?	378
The Workflow Engine	378
Ordering	379
Inventory and Allotment	379

Engineering and Provisioning	379
Activation and Service Management for the Field	379
Network Management and Support	380
What Is OSS Interconnection, and What Does It Mean?	381
What Are the Challenges Facing Interconnection?	382
Upgrading the OSS	382
Efficiencies in Your OSS	383
Remaining Flexible	383
API Functionality and Gateways	383
Supporting Your Data Services	384
Provisioning Data Service	385
Activation of Data Services	386
Broadband Access Changes the Market	386

## **Chapter 8 Designing the Infrastructure      415**

### **Answer Your Questions about Capacity Planning**

**Q:** I have agreed to a Committed Interface Rate (CIR) with a client. How do I charge them if they "burst" over this agreement?

**A:** Most ISP/ASP companies charge what is called the 95 percentile. This is where traffic is measured in timed intervals. You will be charging the customer for whatever their usage is for 95 percent of the time.
